Problem Statement

ATM Cash Withdrawal Validator Phase 1 — COBOL Fundamentals | Difficulty: Beginner Problem Statement An ATM must decide whether a requested cash withdrawal can be processed. Task Read the available balance and requested withdrawal. A withdrawal is valid only when it is positive, does not exceed the balance, and is a multiple of 100. Print the remaining balance for a valid withdrawal otherwise print the applicable rejection message.

Input Format

• Line 1: available balance.

• Line 2: requested withdrawal amount.

Output Format

• Print the remaining balance or a message identifying an invalid amount, insufficient funds, or a denomination error. Constraints

• 0 ≤ balance ≤ 9,999,999

• 0 ≤ withdrawal ≤ 9,999,999

Sample Input

5000 1200

Sample Output

3800

Implementation Notes Define a clear validation order so that one input produces one predictable result.

AIM:

To develop a ATM MACHINE WITHDRAWABLE SYSTEM in which user can deposit , withdraw and check balance.

PROCEDURE:

step 1 : start the program

step 2 : display the user choice 1 to display balance 2 to withdraw 3 to deposit

step 3: loop the process until user choice is 4 exit

step 4 : if user choice is 1 then simply display the balance variable

step 5 : if user choice is 2 check whether withdraw amount less than balance and multiple of 100 if so deduce balance by withdraw amount

step 6 : if user choice is deposit than simle add the amount to the balance variable

step 7 : loop the process until user choice is 4 means exit.

Step 8 : stop the program

PROGRAM:

```
IDENTIFICATION DIVISION.
PROGRAM-ID. ATM-WITHDRAWAL.

DATA DIVISION.
WORKING-STORAGE SECTION.
   01 AMOUNT PIC 9(5) VALUE 0.
   01 WITHDRAW PIC 9(5) VALUE 0.
   01 BALANCE PIC 9(5) VALUE 0.
   01 CHOICE PIC 9 VALUE 0.

PROCEDURE DIVISION.

   PERFORM UNTIL CHOICE = 4
      DISPLAY " "
      DISPLAY "ATM MACHINE DASHBOARD"
      DISPLAY "1. Check Balance"
      DISPLAY "2. Withdraw Amount"
      DISPLAY "3. Deposit Amount"
      DISPLAY "4. Exit"
      DISPLAY "Enter your choice: "
      ACCEPT CHOICE

      EVALUATE CHOICE
```

```
WHEN 1
   DISPLAY "CURRENT BALANCE: "
   DISPLAY BALANCE

WHEN 2
   DISPLAY "Enter amount to withdraw: "
   ACCEPT WITHDRAW

   IF WITHDRAW <= 0 OR FUNCTION MOD(WITHDRAW, 100) NOT = 0
      DISPLAY "Invalid withdrawal amount"
   ELSE
      IF BALANCE < WITHDRAW
         DISPLAY "Insufficient balance"
      ELSE
         COMPUTE BALANCE = BALANCE - WITHDRAW
         DISPLAY "Withdrawal successful"
         DISPLAY "Remaining balance: "
         DISPLAY BALANCE
      END-IF
   END-IF

WHEN 3
   DISPLAY "Enter amount to deposit: "
   ACCEPT AMOUNT

   IF AMOUNT > 0
      COMPUTE BALANCE = BALANCE + AMOUNT
      DISPLAY "Deposit successful"
```

```
            DISPLAY "Updated balance: "
            DISPLAY BALANCE
        ELSE
            DISPLAY "Invalid deposit amount"
        END-IF

    WHEN 4
        DISPLAY "Thank you for using the ATM"

    WHEN OTHER
        DISPLAY "Invalid choice"
  END-EVALUATE
END-PERFORM

STOP RUN.
```

OUTPUT:

```
STDIN
1
3
500
1
```

```
Output:

ATM MACHINE DASHBOARD
1. Check Balance
2. Withdraw Amount
3. Deposit Amount
4. Exit
Enter your choice:
CURRENT BALANCE:
00000

ATM MACHINE DASHBOARD
1. Check Balance
2. Withdraw Amount
3. Deposit Amount
4. Exit
Enter your choice:
Enter amount to deposit:
Deposit successful
Updated balance:
00500

ATM MACHINE DASHBOARD
1. Check Balance
```

RESULT:

Thus the implementation of ATM withdraw machine with features check balance ,deposit, withdraw done successfully.
